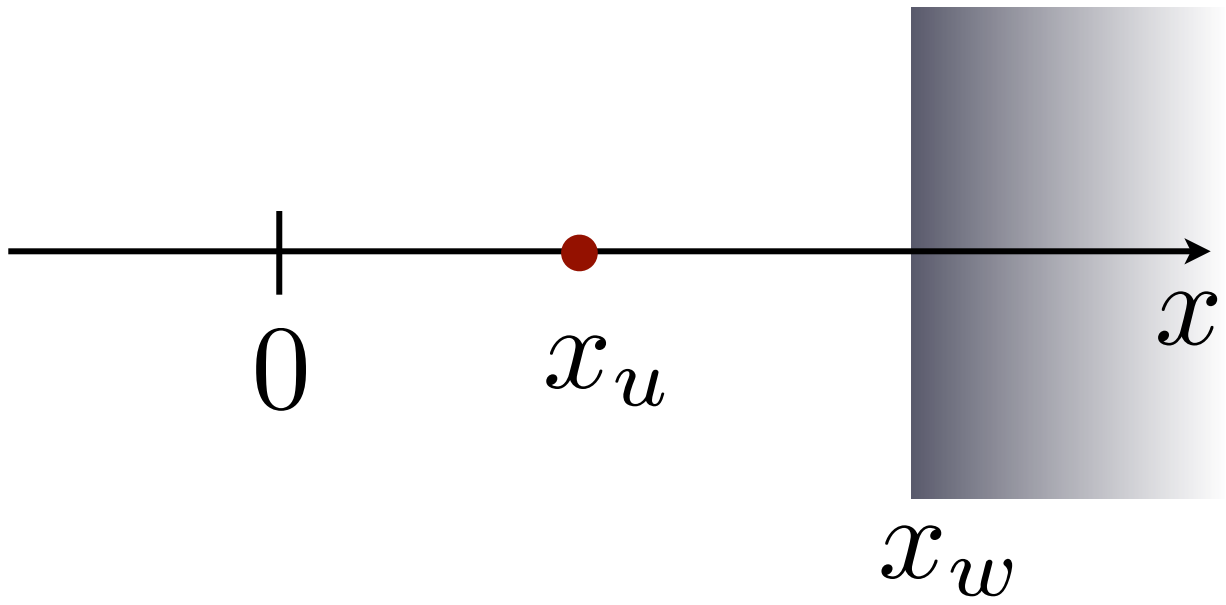
Lecture 17: November 15, 2012

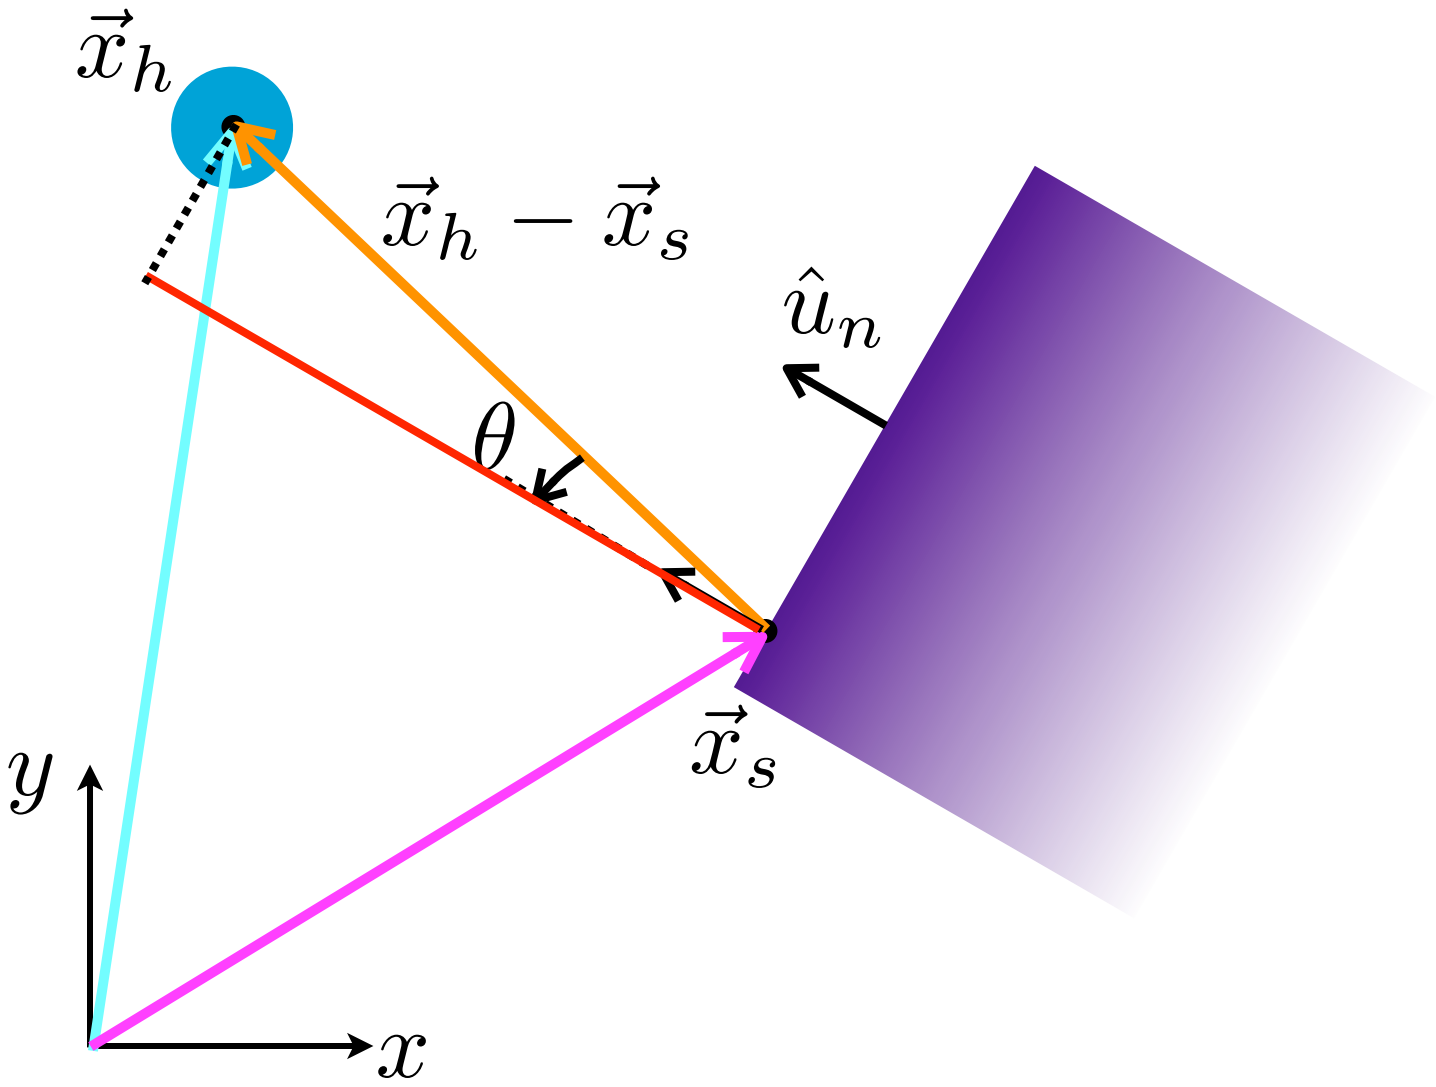
# Haptic Rendering

# Surface Properties: Hardness

How do you program a one-D virtual wall?

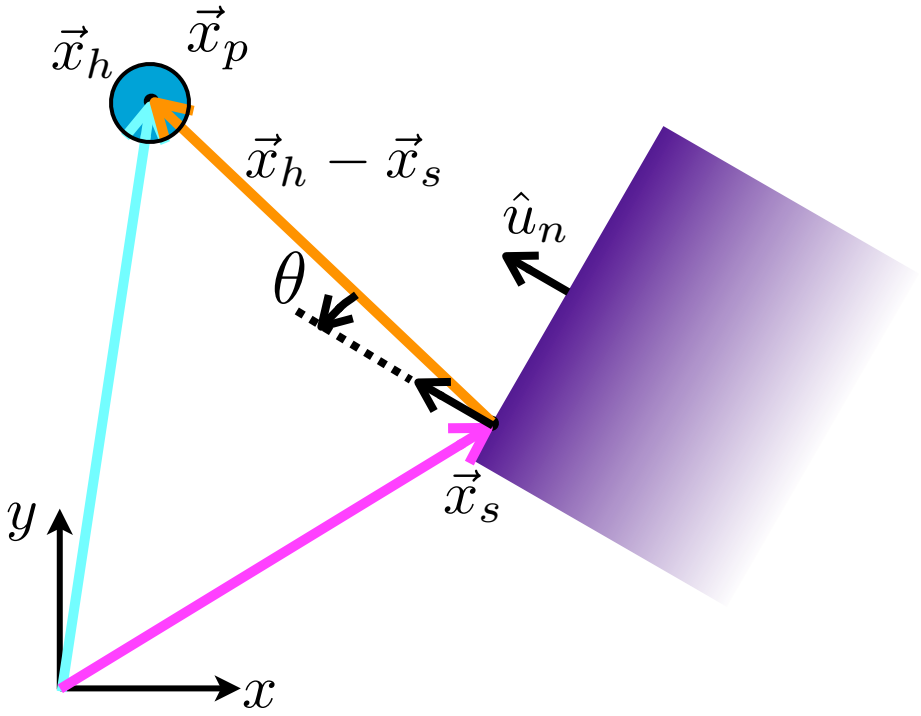


# Standard Surface Rendering in 3D



$$\text{test } (\vec{x}_h - \vec{x}_s) \cdot \hat{u}_n = |\vec{x}_h - \vec{x}_s||\hat{u}_n| \cos\theta = d$$

# Standard Surface Rendering in 3D



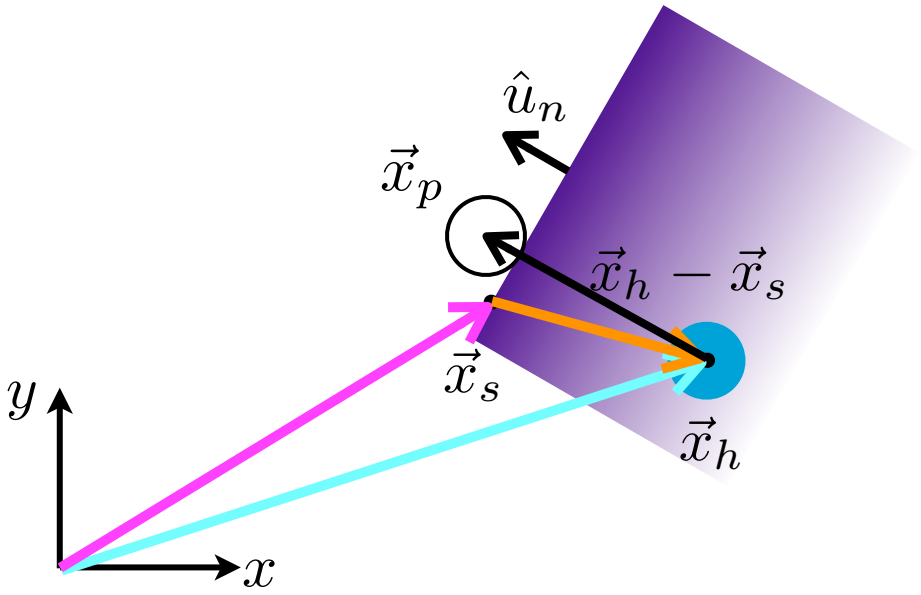
$$d = (\vec{x}_h - \vec{x}_s) \cdot \hat{u}_n$$

Calculate proxy position

$$\text{if } d \geq r_p$$

$$\vec{x}_p = \vec{x}_h, \vec{F} = \vec{0}$$

# Standard Surface Rendering in 3D



$$d = (\vec{x}_h - \vec{x}_s) \cdot \hat{u}_n$$

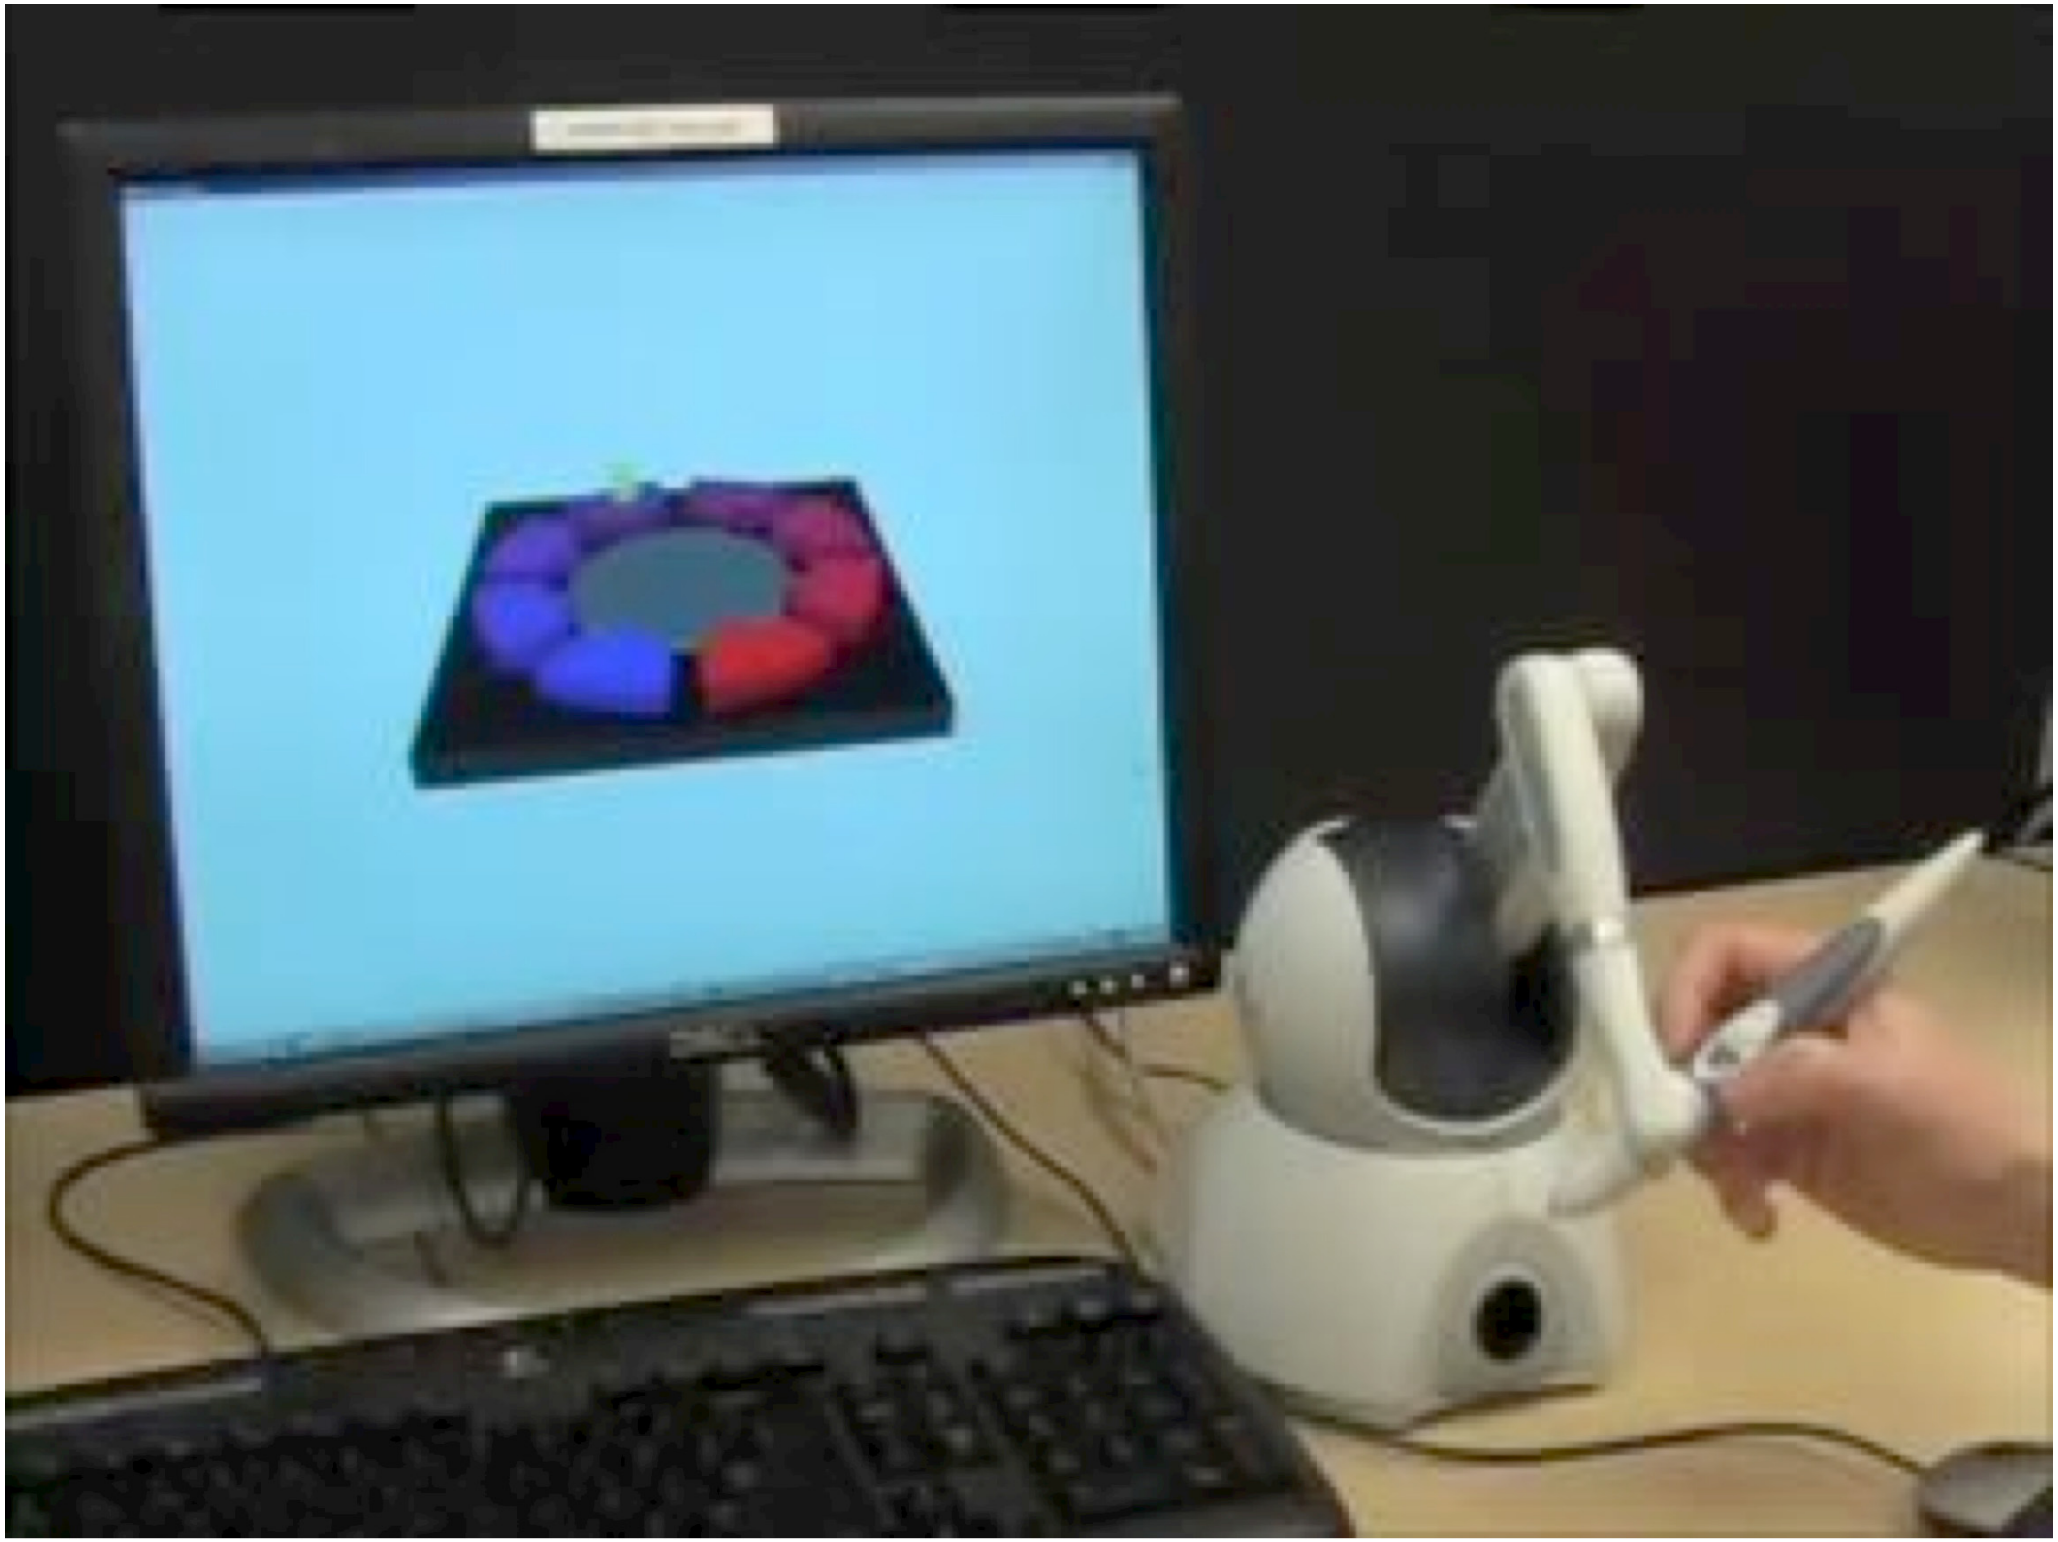
Calculate proxy position

$$\text{if } d < r_p$$

$$\vec{x}_p = \vec{x}_h - d\hat{u}_n + r_p\hat{u}_n$$

$$\vec{F} = -k_s(d - r_p)\hat{u}_n$$

Limited to about 2 N/mm



# Surface Properties: Hardness

Why would you want to make a wall feel harder?

How could you make a wall feel harder?

- Buy a better haptic interface.
- Perhaps try nonlinear stiffness.
- Add damping perpendicular to the plane, but only on the way in.
- Add an event-based force transient perpendicular to the plane for a short time after contact. The magnitude of the transient should scale with the magnitude of the perpendicular velocity.

31. Telerobotics

Telerobotics

Günter Niemeyer, Carsten Preusche, Gerd Hirzinger

In this chapter we present an overview of the field of telerobotics with a focus on control aspects. Motivated by an historical prespective and some challenging applications of this research area a classification of control architectures is given, including an introduction to the different strategies. An emphasis is taken on bilateral control and force feedback, which is a vital research field today. Finally we suggest some literature for a closer engagement with the topic of telerobotics.

## 31.1 Overview

Telerobotics is perhaps one of the earliest aspects of robotics. Literally meaning robotics at a distance, it is generally understood to refer to robotics with a human operator in control or human-in-the-loop. Any high-level, planning, or cognitive decisions are made by the human user, while the robot is responsible for their mechanical implementation. In essence, the *brain* is removed or distant from the *body*.

Herein the term *tele*, which is derived from the Greek and means distant, is generalized to imply a barrier between the user and the environment. This barrier is overcome by remote-controlling a robot at the environment, as indicated in Fig. 31.1. Besides distance, barriers may be imposed by hazardous environments or scaling to very large or small environments. All barriers have in common that the user cannot (or will not) physically reach the environment.

While the physical separation may be very small, with the human operator and the robot sometimes occupying the same room, telerobotic systems are often at least conceptually split into two sites: the local site with the human operator and all elements necessary to support the system's connection with the user, which could be joysticks, monitors, keyboards, or other input/output devices, and the remote site, which contains the robot and supporting sensors and control elements.

To support this functionality, telerobotics integrates many areas of robotics. At the remote site, to operate the robot and execute the human's commands, the system may control the motion and/or forces of the robot. We refer to Chaps. 6 and 7 for detailed descriptions of these areas. Also, sensors are invaluable (Chap. 4), including force sensors (Chap. 19) and others (Part C). Meanwhile, at the local site information is often displayed haptically (Chap. 30).

A recent addition to telerobotics is the use of computer networks to transmit information between the two sites. This is the focus of Chap. 32 and opens up new possibilities in architectures. For example a single robot may be shared between multiple users or a single user may

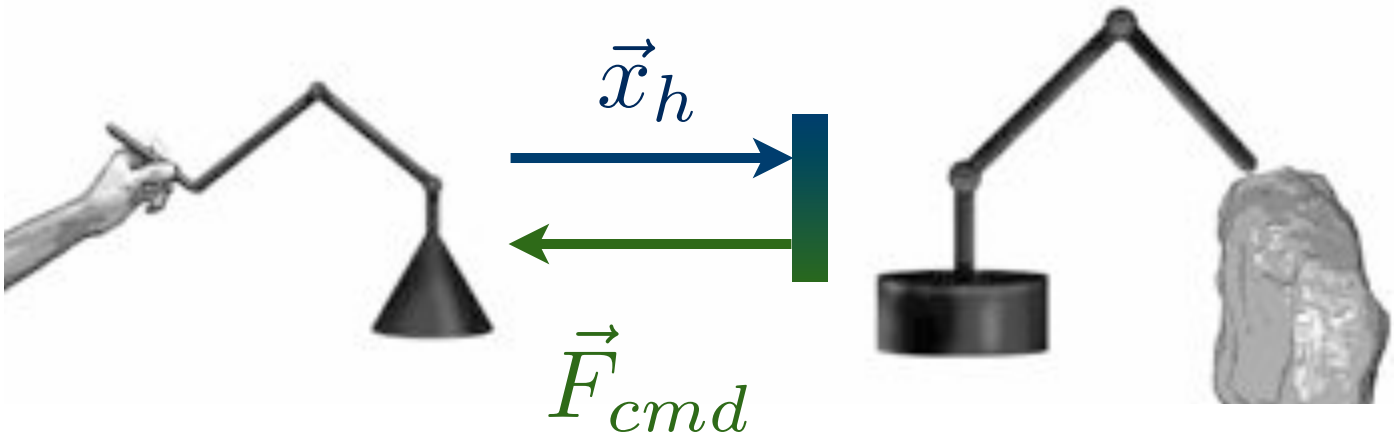
Springer Handbook of Robotics
Siciliano, Khatib (Eds.) · ©Springer 2008

G. Niemeyer, C. Preusche, and G. Hirzinger. Telerobotics. Chapter 31 in *Springer Handbook of Robotics*, Siciliano and Khatib, Eds., pp. 741–757. 2008.

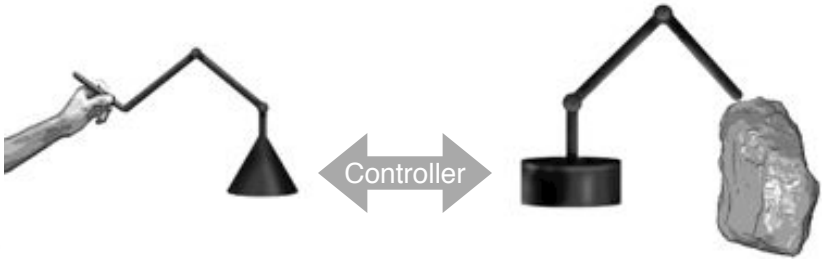
Provides a good introduction to the topic of teleoperation, including discussions of varying levels of remote robot autonomy and different control schemes for achieving force feedback.

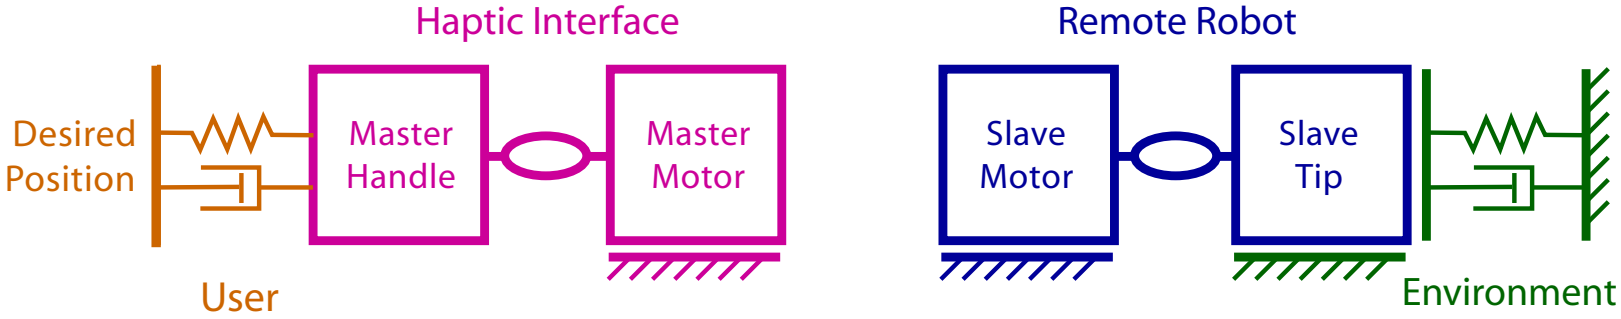
# Teleoperation



- Teleoperation has always been tightly intertwined with robotics, especially manipulators.
- Control system design is a primary concern:
  - Stability
  - Transparency

# Teleoperation

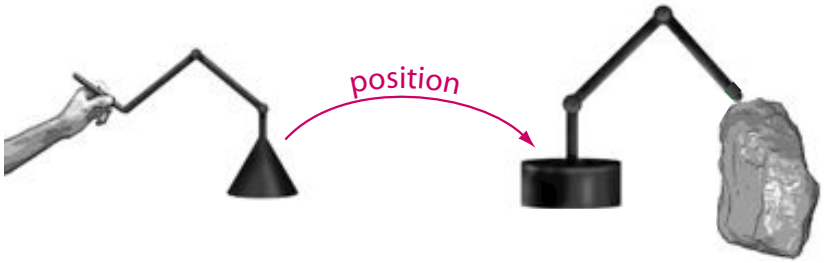


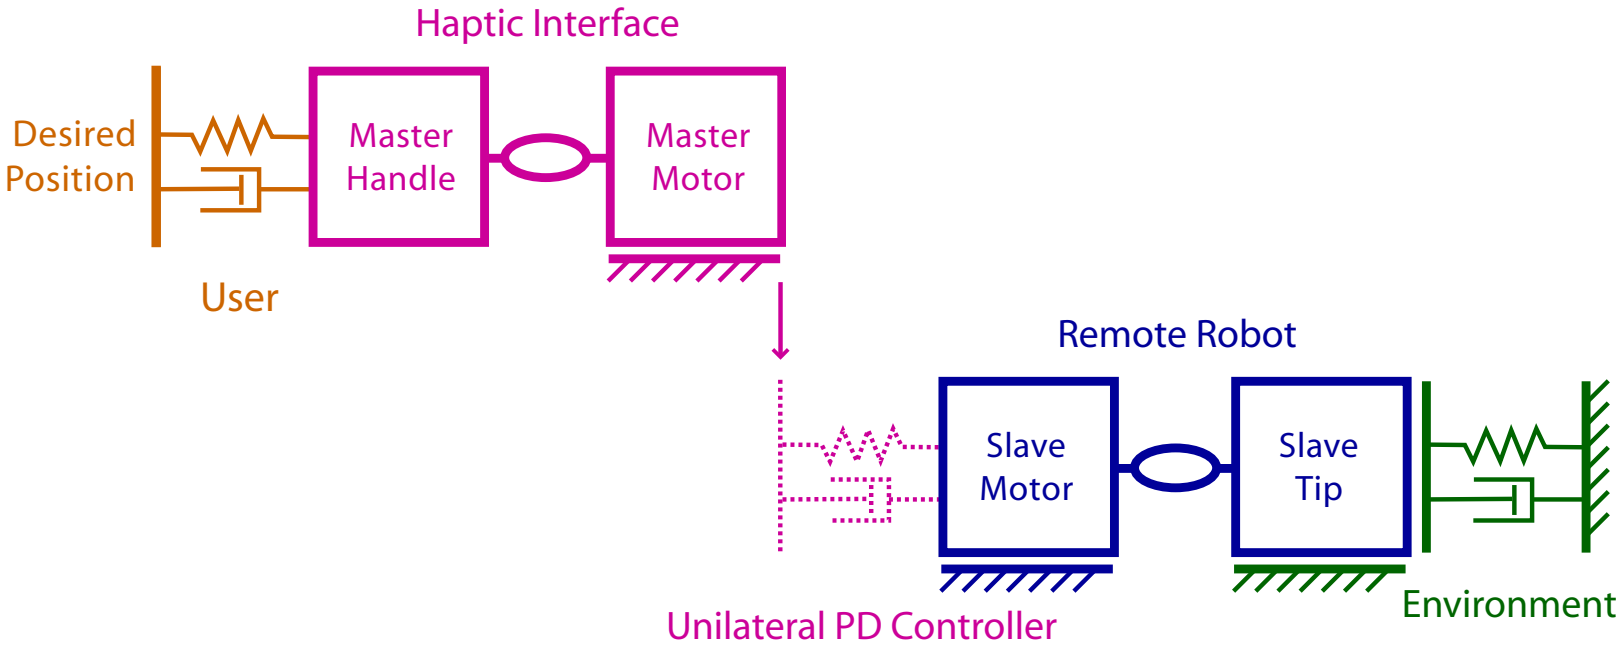


How do we want this system to behave?

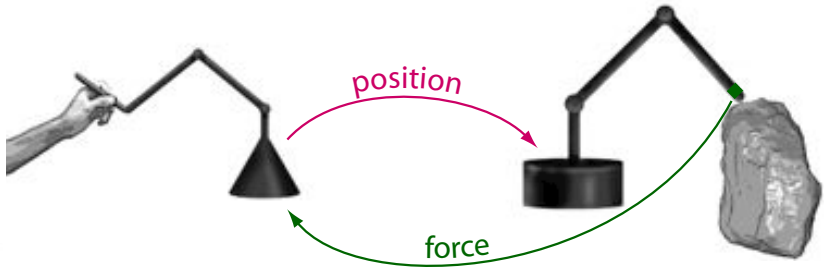
How should we connect the sensors and actuators of the master and slave to make the system behave well?

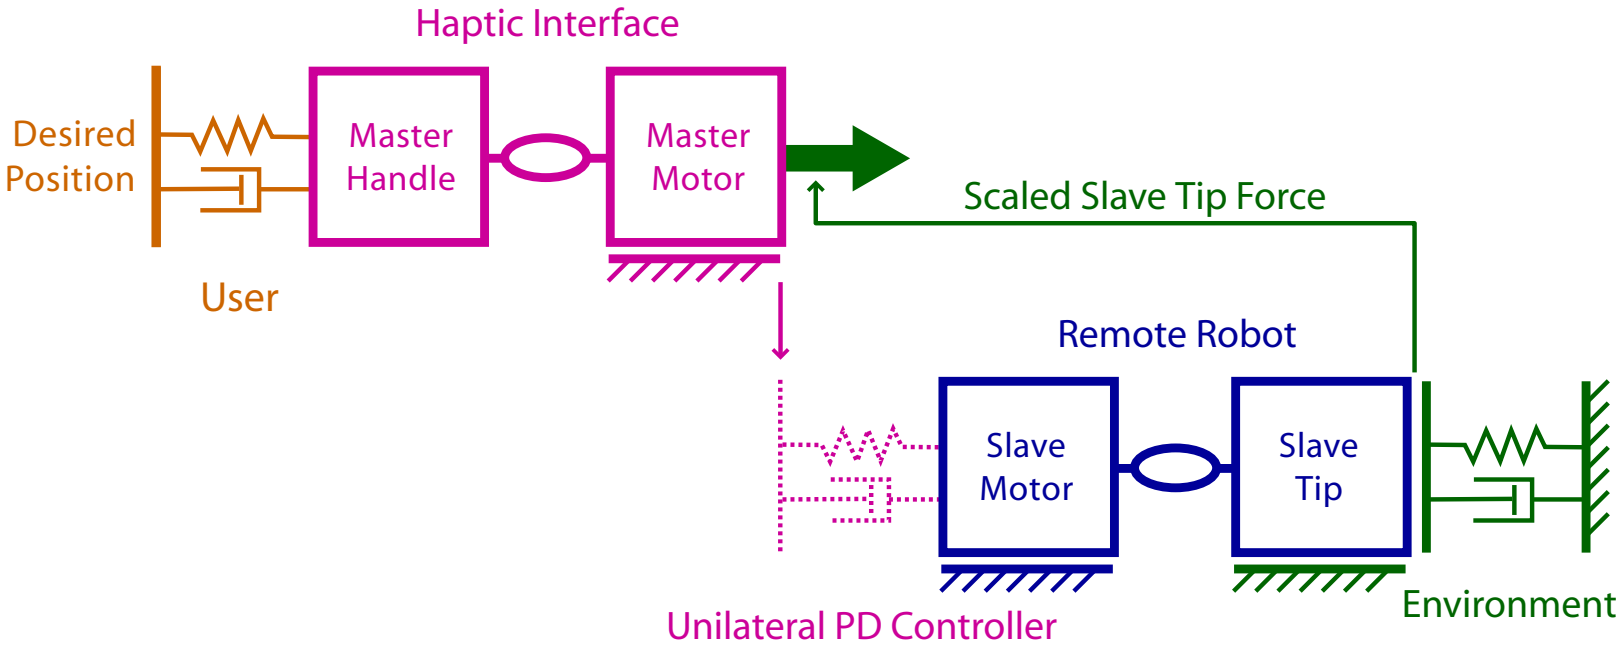
# Position-Forward Control



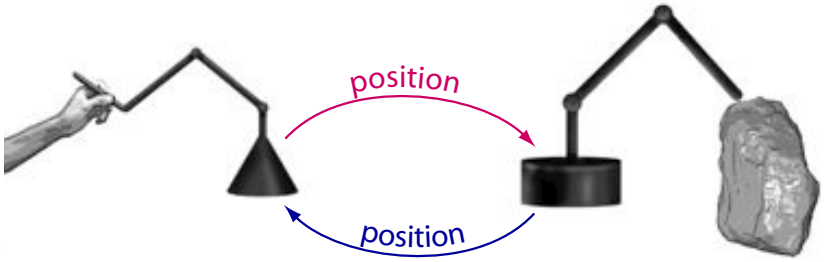


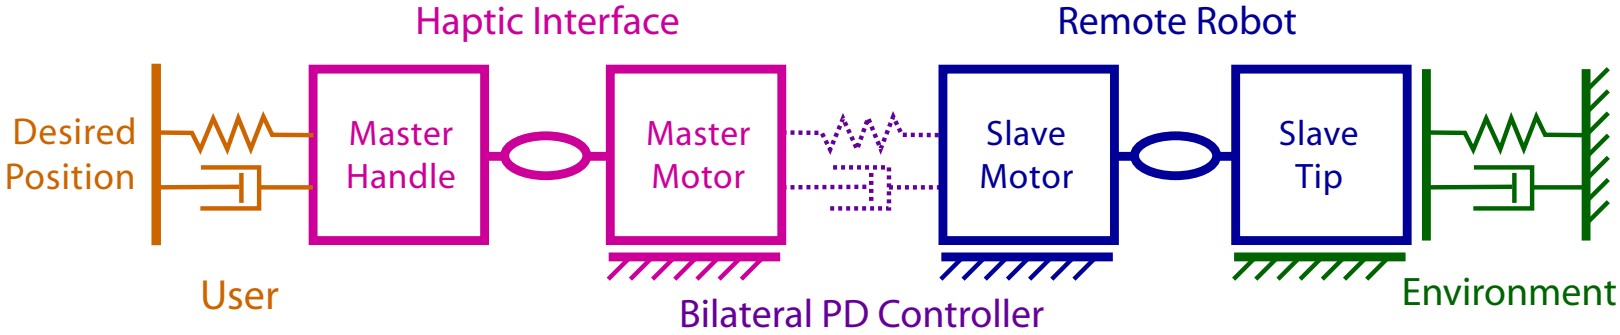
# Position-Force Control



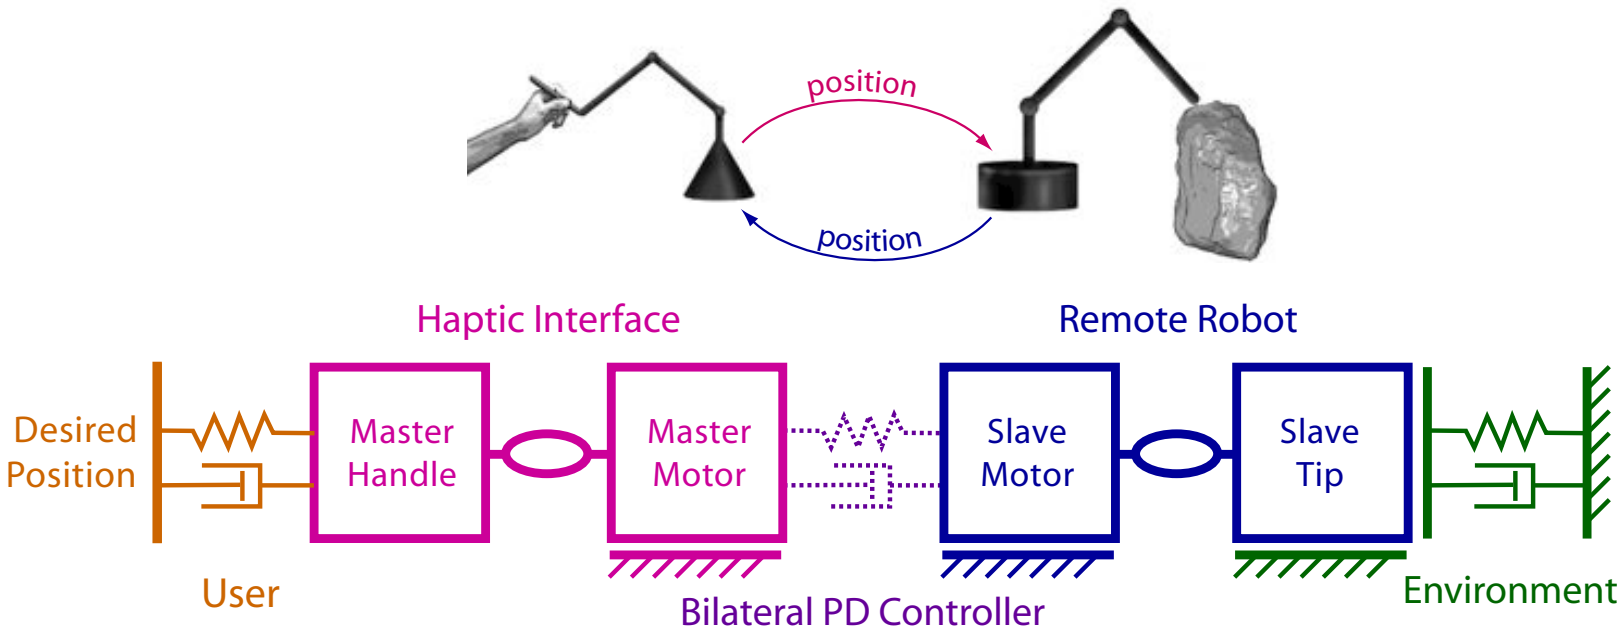


# Position-Position Control





# Position-Position Control



- With two impedance-type (backdrivable) devices, the most common controller is position-position, also known as position exchange.
- Each device has a desired state (position and velocity), which is computed from measured states.
- Separate controllers try to make each device achieve its desired state by using the motors to output forces.

# Midterm Exam

MEAM 520, Introduction to Robotics
University of Pennsylvania
Katherine J. Kuchenbecker, Ph.D.

November 8, 2012

You must take this exam independently, without assistance from anyone else. You may bring in a calculator and two 8.5"×11" sheets of notes for reference. Aside from these two pages of notes, you may not consult any outside references, such as the textbook or the Internet. Any suspected violations of Penn's Code of Academic Integrity will be reported to the Office of Student Conduct for investigation.

This exam consists of several problems. We recommend you look at all of the problems before starting to work. If you need clarification on any question, please ask a member of the teaching team. When you work out each problem, please show all steps and box your answer. On problems involving actual numbers, please keep your solution symbolic for as long as possible; this will make your work easier to follow and easier to grade. The exam is worth a total of 100 points, and partial credit will be awarded for the correct approach even when you do not arrive at the correct answer.

| | Points | Score |
|---|---|---|
| Problem 1 | 20 | |
| Problem 2 | 20 | |
| Problem 3 | 15 | |
| Problem 4 | 20 | |
| Problem 5 | 25 | |
| Total | 100 | |

**I agree to abide by the University of Pennsylvania Code of Academic Integrity during this exam. I pledge that all work is my own and has been completed without the use of unauthorized aid or materials.**
